HOW TO CHANGE YOUR MOUSE CURSOR SPEED

On Windows 10, the mouse is an essential component that allows you to navigate and complete actions on the desktop and applications quickly and more efficiently.

However, a mouse can only be efficient if you configure its settings to meet your requirements. Since it's a peripheral that receives analog inputs, and the preferences will always vary per individual.

Some people may prefer to move the cursor fast (especially in a multi-monitor setup), and others may prefer a slower speed to make it easier to execute actions and keep track of the pointer on the screen more easily.

Whatever your preference might be, Windows 10 includes at least two easy ways to adjust the mouse speed sensitivity using the Settings app and Control Panel to help use the device more accurately.

Option 1:

1. Go to Settings (Windows + I)
2. Click on Devices.
3. Click on Mouse.

Option 2:

1. Go to Search and type Control Panel
2. Click on Mouse.
3. Click on the Pointer Options tab.
