

How to Create Tile Groups in the Start Screen

While using the Windows 10 Start screen, you can organize your tiles by creating groups. (Although you cannot place tiles into folders on the Start screen, you can drag and drop the target tiles to the Desktop where they will become shortcuts. As shortcuts, they can be collected into Desktop folders.)

Having your apps contained in a group makes it easier for you to quickly find your favorite apps.

To create a new group, all you have to do is left drag and drop your chosen tiles to another location, just until a gray vertical or horizontal bar appears that isolates the target tiles from all the others. Once you have the target tiles clustered into a new group, it is easy to assign a unique name to the group.

How to Name your App Groups

Naming a group is a simple task. Simply click on a blank space immediately above the target cluster. Now click on the Name group bar that appears at the top of each cluster and enter the name. Now click on any blank space on the Start screen and you will be taken back to the normal screen.

How to Move a Group to Another Location

If you want to move the entire group to another location on the Start screen, simply drag and drop the group by its name group bar.
