

KeePass Password Safe

KeePass Password Safe is an encrypted "safe" where you can keep all manner of sensitive information locked behind a password. It was originally designed as a password safe such that you could put all of your various credentials in it but only have to remember the master password to open the safe.

If you've spent enough time on the Web, you've accumulated a lot of accounts on different websites. In addition to your normal username/password combinations, you might store such items as your library card and PIN, your credit cards, your Cox password, or your Microsoft account.

When you launch *KeePass* for the first time, you'll be prompted to create an empty safe.

Note that the safe is split into two vertical panes. On the left are the categories into which you can group your individual entries and on the right are the entries themselves. The default safe comes with the categories you see above, but you can easily rename, move, or delete them – or add your own.

The entries themselves contain fields for Title, Username, Password, URL, and Notes. It's quite simple to add, edit, and delete entries. And if you accumulate a lot of entries, you'll find the Search capability a very handy feature.

KeePass Password Safe is a free download available for Windows 10. It can be retrieved from this site:
